

COMPREHENSIVE SERVICES

We offer competitive repair and calibration services, as well as easily accessible documentation and free downloadable resources.

SELL YOUR SURPLUS

We buy new, used, decommissioned, and surplus parts from every NI series. We work out the best solution to suit your individual needs.

 Sell For Cash  Get Credit  Receive a Trade-In Deal

OBSOLETE NI HARDWARE IN STOCK & READY TO SHIP

We stock **New**, **New Surplus**, **Refurbished**, and **Reconditioned** NI Hardware.

Bridging the gap between the manufacturer and your legacy test system.

PCI-MXI-2

NI-VXI FOR NB-MXI FOR MACINTOSH AND POWER MACINTOSH

Thank you for purchasing the NI-VXI bus interface software for Macintosh from National Instruments. These release notes contain information about compatibility that you need if you will be developing applications using NI-VXI for both the NB-MXI and the PCI-MXI-2, or if you will be migrating an application from one of these MXIbus interfaces to the other.

Power Macintosh Compatibility Library

With the introduction of PCI-based Power Macintosh systems, National Instruments now offers two MXI solutions for controlling VXI systems using a Macintosh computer—the NB-MXI and the PCI-MXI-2.

NuBus-based Macintosh computers use a 680x0-based Device Manager. Even if the computer has a PowerPC microprocessor, those machines will still run an emulated 680x0 version of the Device Manager. Therefore, the NI-VXI device driver for the NB-MXI is a 680x0 device driver, and runs emulated on a Power Macintosh.

PCI-based computers, on the other hand, use a PowerPC-native Device Manager. Therefore, the NI-VXI device driver for the PCI-MXI-2 is a fully PowerPC-native implementation of NI-VXI.

This release of the NB-MXI driver software includes a compatibility library for Power Macintosh. You can use this library to develop PowerPC-native applications that call the emulated NB-MXI driver. If you develop your native applications using this library, they will run without modification on the PCI-MXI-2. If you develop a 680x0 application using NI-VXI, you will need to recompile it as a PowerPC-native application if you want to run it on a PCI-MXI-2.

LabVIEW[®], NI-VISA[™], and NI-VXI[™] are trademarks of National Instruments Corporation. Product and company names are trademarks or trade names of their respective companies.

The following table shows what file to link with when developing your NI-VXI C programs.

Platform	680x0 Application	Native Application
NB-MXI	cvxi.c (Located in C language interface directory)	NI-VXI for NB-MXI (Located in Extensions Folder)
PCI-MXI-2	Not supported	NI-VXI for PCI-MXI-2 (Located in Extensions Folder)

Binary Compatibility

To ensure binary compatibility between the NB-MXI and the PCI-MXI-2, you must define the symbol `BINARY_COMPATIBLE` before including the NI-VXI header file. Defining this symbol forces NI-VXI to use a binary-compatible method for accessing registers rather than optimizing low-level macros for the particular MXI interface you are using.

The following code shows the syntax for the `#define` and `#include` statements.

```
...  
#define BINARY_COMPATIBLE  
#include <nivxi.h>  
...
```

NI-VISA and LabVIEW

You do not need to modify NI-VISA applications or LabVIEW VIs when migrating from NuBus to PCI.
